This document is intended solely for WattWise founding team and authorized investors. Do not distribute.

WHERE YOU ARE NOW

00 Executive Summary

Phases 1 and 2 of WattWise are complete. You have a fully deployed, tested, and validated B2B SaaS + IoT platform — monorepo, Go backend, Python ML stack, React dashboard, WattBrain edge firmware, a physics-accurate digital twin, chaos engineering suite, and seed pitch assets. No competitor in Pakistan has come close to this level of technical readiness at the pre-revenue stage.

Phase 3 is about one thing: converting technical completeness into commercial traction. This means getting the first shadow pilot signed, activating the first paying customer, retraining your ML models on real factory data, building the operational foundation that scales to 20 customers, and closing a USD 250,000 seed round — all within 90 days.

90 days	3 phases	Rs. 867M	USD 250K
to first revenue	within Phase 3	36-month ARR target	seed round target

■ Phase 3 Core Thesis

The product is built. The validation is done. Every day spent on more engineering without a paying customer is a day of zero feedback and zero revenue. Phase 3 starts in the market, not in the code editor. Engineering only happens when a real customer reveals a gap.

Phase 3 — Three Sub-Phases Over 90 Days

Sub-Phase	Weeks	Goal	Exit Criterion
3A · Pilot Activation	1–4	Shadow monitoring → first automation live	1 factory with live SwiftSwitch™
3B · First Revenue	5–8	First gain-share invoice issued and paid	Rs. 1M+ collected from first customer
3C · Scale to 20	9–12	Replicate to 10–20 factories, seed round closed	Rs. 20M+ MRR, USD 250K seed closed

3A · WEEKS 1–4

01 First Pilot Activation

Weeks 1–4: Shadow Monitoring to Live Automation

Week 1: Shadow Install Day

The physical installation should take one visit of 3–5 hours. Bring everything pre-configured. The factory should experience zero production interruption.

Weeks 1–4: 30-Day Shadow Period

During the shadow period, WattWise runs in monitoring-only mode. No relay control. No automation. No production risk. Check sensor health daily, log actual outage times, send weekly Urdu summaries, retrain the GOP model on real feeder data, and prepare the 30-Day Energy Audit Report.

Week 4: The Handover Meeting

Present the 30-Day Audit Report in person. The factory owner should see a number they cannot ignore. Ask for permission to connect the SwiftSwitch™ relay module to the ATS control signal and run a one-day controlled trial.

▲ Non-Negotiable Before Leaving Site

Verify CT readings are changing live in the dashboard, confirm 4G connectivity, and make sure the factory manager has the WattWise contact number.

02 ML Model Retraining on Real Data

Weeks 2–6: From Simulator to Factory-Trained Models

The Retraining Cycle

Run the cycle once every 30 days per factory and after major WAPDA policy changes. Retrain GOP, LoadShift MILP, Prophet baseline, and anomaly detection using factory-specific data.

Feeder-Specific GOP Improvement

Use actual trip timestamps, schedule deviation patterns, voltage-sag fingerprints, and seasonal corrections. Factory-specific data becomes a durable competitive advantage.

Continuous Training Pipeline

Automate nightly retraining with quality gates: only deploy a new model when it is strictly better than the current factory model.

■ Data Moat

Every week of real factory data can improve factory-specific predictions. Protect data quality, model evaluation, and deployment gates.

3B · WEEKS 5–8

03 First Revenue: Billing & Collection

Weeks 5–8: From Live Automation to Paid Invoice

The First Month Billing Cycle

SwiftSwitch goes live, the baseline is locked, savings are calculated from actual consumption, a savings certificate is generated, the FBR-compliant invoice is issued, and payment is reconciled.

Pakistan B2B Payment Collection

Primary method: IBFT. Maintain cheque as a fallback and document payment terms, reconciliation, and invoice follow-up.

First Invoice Psychological Moment

Walk the factory owner through every line of the savings certificate before sending the invoice. Trust in the calculation is part of the product.

■ First Invoice Trust Moment

Walk the customer through the baseline, actual consumption, savings calculation, fee, and net gain before requesting payment.

OPS · ONGOING

04 Operational Runbook

Day-to-Day Operations for a 1–20 Factory Fleet

Daily Operations

Check sensor status, switchover logs, GOP prediction accuracy, Kafka lag, billing alerts, anomaly alerts, and nightly ML retraining.

Weekly Operations

Send factory energy summaries, review model drift, conduct customer health checks, track sales outreach, and review cloud-cost allocation.

Incident Response

SEV-1: production-impacting relay issue; SEV-2: critical sensor dropout; SEV-3: dashboard outage; SEV-4: degraded ML accuracy. Define response times and escalation paths.

■ On-Call Discipline

Until a team exists, maintain an explicit escalation path and test incident recovery. Production-impacting events require immediate human attention.

3C · WEEKS 5–12

05 Customer 1 → 20: The Replication Playbook

Weeks 5–12: Systematizing Customer Acquisition

The WattWise Growth Flywheel

Install → Audit → Go Live → First Bill → Referral → Case Study. Make the referral request automatic after successful payment.

APTMA Penetration Strategy

Use the first customer as an introduction, then present measured case-study results to APTMA chapters and propose a member pilot.

Sales Motion

Standardize discovery, savings estimate, agreement, install, 30-day shadow period, activation, and invoice/payment into one repeatable pipeline.

LEGAL · MONTH 1

06 Legal Infrastructure & Compliance

Contracts, PSQCA, NEPRA & FBR — Complete This Month

Critical Legal Documents

Prioritize customer agreement, data-processing terms, hardware deployment/return agreement, IP/NDA documents, ESOP/vesting, and founders' agreement.

PSQCA Hardware Certification

Prepare technical files, submit applications, complete laboratory testing and inspections, and obtain certification before commercial relay-control deployment.

FBR & Tax Structure

Have Pakistani legal and tax professionals verify corporate tax, sales tax, withholding, import duties, and applicable registrations before relying on the estimates in this playbook.

■ Legal Review Required

The regulatory and tax figures in the supplied draft are planning assumptions. Have Pakistani counsel and a qualified tax adviser verify them before commercial deployment.

HIRING · MONTHS 1–4

07 Team Building: First 4 Hires

Months 1–4: Who to Hire and in What Order

Co-Founder CEO

Find rather than hire: someone with textile-industry connections, Punjabi/Urdu fluency, and B2B sales instincts.

Field CSR / Customer Success

A field-oriented customer-success hire can manage weekly updates, invoice follow-up, troubleshooting visits, and installation support.

Backend / ML Engineer

After initial revenue, add an engineer responsible for model retraining, production monitoring, and backend development.

PRODUCT · MONTHS 1–6

08 Product Iteration: Features Your First Customers Will Request

Months 1–6: Build Only What Customers Actually Ask For

Customer-Driven Feature Policy

Log every feature request with the customer and problem. Prefer requests validated by multiple customers rather than speculative development.

Likely Requests

Multi-user RBAC, WhatsApp reporting, WAPDA bill analysis, generator fuel tracking, email digests, multi-factory views, ESG/carbon reporting, and load-factor recommendations.

The Feature Trap

Before building a feature, validate willingness to pay and the underlying problem. Avoid three-week builds that customers do not adopt.

PARTNERSHIPS · MONTHS 2–6

09 Strategic Partnerships: Banks, APTMA & NEPRA

Months 2–6: Unlock the Next Revenue Layer

Bank / ESCO Financing

Use verified savings records as evidence for financing energy-efficiency upgrades and explore referral partnerships.

APTMA Channel

After several successful case studies, propose a formal member-benefit program and aggregate anonymized savings results.

NEPRA Demand Side Management

Monitor the regulatory framework and assess whether an aggregated industrial demand-response model is legally and commercially viable.

FUNDRAISING · MONTHS 2–4

10 Seed Round Execution

Months 2–4: Closing USD 250,000

Fundraising Calendar

Treat fundraising as a pipeline: polish materials with real pilot data, pursue grants/incubators, conduct warm outreach, secure angel commitments, then pursue institutional VC.

Investor Questions

Be prepared to answer willingness to pay, defensibility, load-shedding risk, founder-market fit, traction, and exit strategy with evidence rather than assumptions.

The Most Important Asset

A short live demo using real factory data and showing the product working is more persuasive than a large slide deck.

■ Fundraise From Evidence

Use actual pilot metrics, signed agreements, collected revenue, retention signals, and a live product demo as the primary proof points.

MASTER PLAN · 90 DAYS

11 The 90-Day Execution Calendar

Week-by-Week Priorities for Phase 3

Weeks 1–4

Secure the first shadow agreement, install hardware, establish daily operations, complete legal foundations, and retrain the first model on real data.

Weeks 5–8

Deliver the audit, activate SwiftSwitch, issue the first invoice, collect payment, record the live demo, and start investor outreach.

Weeks 9–12

Install additional factories, hire customer-success support, activate customers #2–3, deepen the APTMA relationship, and close or advance the seed round.

■ Phase 3 Ends When

You have paying live factories, a credible fundraising outcome, the first key hire, and a repeatable acquisition/activation process. Then Phase 4 can focus on scaling.
